NEW LIFE CARE

Website Development Blueprint

Product concept • Website structure • Features • Design • Technical delivery

Purpose

A practical planning document for the team developing the first New Life Care website. It turns the competitor research and product ideas into an organised scope of work, with page requirements, differentiating features, implementation phases and quality checks.

Product direction

Build a calm, trustworthy, mobile-first digital recovery and support platform. Start with an accessible public website and prepare the architecture for future patient and aftercare features without overbuilding the first release.

Internal team planning document

1. Product Vision

Brand positioning: A trusted place for recovery, support and a new beginning.

The website should help visitors understand available support, learn about treatment, and contact the centre with dignity and confidence. It must serve both people seeking help for themselves and family members looking for guidance.

Core principles

- **Confidentiality:** Explain what information is collected, why it is needed, who can access it and how enquiries are handled. Do not promise anonymity if identifying details are collected.
- **Clarity:** Use plain language, clear navigation, realistic treatment descriptions and visible contact options.
- **Continuity:** Explain recovery support and aftercare where these services are actually offered.
- **Trust:** Publish only verified staff credentials, centre details, services, testimonials and outcome claims.
- **Accessibility:** Make the website readable and usable on phones, with keyboard-friendly controls, sufficient contrast and captions for videos.

Proposed homepage headline

“Recovery Starts With One Small Step.”

Primary homepage choices: “I Need Support” and “I’m Helping Someone”. Each should lead to relevant resources and a clear next step.

2. Sitemap and Page Requirements

Page / section	Required content and behaviour
Home	Brand introduction, verified services, support pathways, recovery overview, facilities preview, educational resources, contact details and clear enquiry actions.
Addiction & Treatment	A landing page linking to separate pages for conditions actually treated by the centre.
Condition pages	Alcohol, smoking/tobacco, drug addiction and other relevant conditions only where the centre provides support. Explain the concern, when to seek professional help, treatment options, FAQs and next steps.
Treatment approach	Assessment, appropriate medical care, counselling, rehabilitation, family involvement, discharge planning and aftercare, limited to verified services.
Our Team	Approved professional profiles, qualifications, specialisations, responsibilities and profile photos where consent is provided.
Learn & Recover	Educational videos, articles, FAQs, recovery guidance and family resources, reviewed for accuracy.
Family Support	Guidance for supportive conversations, how families may participate, practical FAQs and signs that need urgent professional attention.
Our Centre	Authentic facility photos, accommodation information, activities, visitor rules, what to bring, admission steps and a sample daily schedule if accurate.
Contact & Admission	Phone, enquiry form, location/map, opening hours, admission process and what happens after an enquiry.
Privacy & Policies	Privacy policy, confidentiality explanation, patient rights, consent, terms and cookie information where applicable.

3. Differentiating Features

A. Private Help Centre

- Let visitors browse support options without creating an account.
- Provide a short callback request with preferred contact method/time and minimal necessary details.
- Explain data collection and access before submission; restrict staff access to enquiries.
- Do not claim complete anonymity where phone numbers or other identifiers are collected.

B. Family Support Navigator

- Provide guidance for starting a supportive conversation and avoiding stigma or blame.
- Explain how families may participate in care, subject to patient consent and centre policy.
- Include practical FAQs and clear instructions for urgent medical situations.

C. Interactive Recovery Roadmap

- Use an accessible step-by-step visual: Understand → Assessment → Appropriate care → Recovery skills → Continuing support.
- Explain that the journey differs by person and clinical needs.
- Only show services and stages that match the centre's actual programme.

D. Recovery Learning Library

- Organise content by topic: alcohol, tobacco, drugs, withdrawal safety, family support and relapse prevention.
- Support Tamil and English content where feasible, captions and transcripts.
- Have health content reviewed by a qualified professional; do not present videos as diagnosis or personalised medical advice.

E. Recovery Toolkit

- Offer downloadable question lists, family conversation guides, admission checklists and aftercare worksheets.
- Avoid storing private journals or sensitive self-assessment answers in the first release.
- Keep resources accessible without requiring an account wherever possible.

F. Explore Our Centre

- Use real, current photographs with appropriate consent.
- Explain accommodation, activities, visiting rules and what to bring.
- Offer a virtual tour only if genuine images and facilities are available.

G. Guided Enquiry and Admission

- Ask only for information needed to respond to the enquiry.
- Provide a clear acknowledgement and explain expected next steps.
- Do not expose sensitive details in email/WhatsApp notifications or public URLs.

H. Aftercare Portal — Future Phase

- Consider appointment reminders, aftercare resources and follow-up scheduling.
- Require authentication, role-based access, consent and a documented data-retention approach.
- Build only after the public website and operational workflows are stable.

4. UI / UX Design Direction

Visual style: calm, premium, human-centred and reassuring. Avoid a generic hospital template, overdone animations or imagery that sensationalises addiction.

Design element	Recommendation
Colour palette	Deep teal, warm ivory, muted green and charcoal. Use contrast-tested colours for text and buttons.
Typography	Readable sans-serif fonts, clear heading hierarchy, comfortable line length and generous spacing.
Imagery	Authentic centre photos and respectful, consented imagery. Avoid misleading before/after claims or unlicensed testimonials.
Motion	Subtle transitions only; respect reduced-motion preferences and never make essential information depend on animation.
Navigation	Simple top navigation, obvious contact action, breadcrumb/navigation clarity on deeper pages.
Mobile experience	Responsive layouts, large tap targets, quick loading and forms that are easy to complete on small screens.
Accessibility	Keyboard support, visible focus, labelled forms, alt text, captions, readable contrast and clear validation messages.

Suggested reusable UI components

- Header/navigation, footer, page hero, service cards, treatment-step timeline, professional profile card, video/resource card, FAQ accordion, contact panel, callback form and privacy notice.

5. Enquiry Workflow

Recommended initial flow

Step	Expected behaviour
1. Visitor selects support	Choose personal support, family guidance or a general question. Do not require sensitive disclosures.
2. Visitor chooses contact option	Phone, callback request or approved messaging channel. Show the centre’s real contact details.
3. Minimal form	Collect only necessary contact details, preferred time and a short optional message. Include a clear privacy notice and consent where required.
4. Secure handling	Store submissions securely, restrict access to authorised staff, validate inputs and protect against spam.
5. Confirmation	Explain that the enquiry was received and state the actual expected response process. Do not promise instant response unless staffed.

6. Suggested Technical Architecture

The exact stack should be agreed by the team before implementation. A simple public website can launch without a patient portal; choose technology the team can maintain securely.

Layer	Initial scope
Frontend	Responsive, component-based website; semantic HTML; reusable page templates; accessible forms and navigation.
Content management	Either a manageable CMS or a lightweight admin workflow for updating services, articles, FAQs, videos and contact details.
Backend (if needed)	Secure endpoint for callback/enquiry submissions, server-side validation, spam protection and authorised admin access.
Data storage	Store only necessary enquiry records. Define retention, deletion and access rules before choosing schema.

Layer	Initial scope
Hosting and operations	HTTPS, environment-based secrets, backups, error monitoring, uptime checks and a documented deployment process.
Future portal	Separate authenticated area with role-based access, audit logs and stronger privacy/security review before handling patient information.

7. Delivery Phases and Priorities

Phase	Scope	Definition of done
Phase 1 — Foundation	Brand/UI system, homepage, navigation, condition pages, treatment approach, team, centre and contact pages.	Responsive, accessible pages with verified content and working links.
Phase 2 — Trust and enquiries	Privacy/policies, secure enquiry flow, FAQs and family support content.	Forms validated, submissions securely handled, privacy copy reviewed and confirmation tested.
Phase 3 — Differentiators	Recovery roadmap, bilingual learning library, toolkit downloads and authentic facility tour where available.	Content reviewed, captions/transcripts included and all resources work on mobile.
Phase 4 — Future operations	Admin content management and, if justified, authenticated aftercare portal.	Role/access controls, audit and retention rules, security tests and user acceptance sign-off.

8. Security, Privacy and Clinical Content Guardrails

- Collect the minimum personal information necessary; do not invite visitors to submit detailed medical histories through a general contact form.
- Use HTTPS, server-side validation, anti-spam controls, restricted staff access and secure secret management.
- Publish a clear privacy notice explaining purpose, access, retention and contact for privacy questions; obtain appropriate consent.
- Do not add advertising trackers to sensitive enquiry flows without a careful privacy review.
- Only publish verified staff credentials, treatment services, centre facilities, testimonials and outcome claims.
- Do not guarantee recovery or present educational content as a diagnosis or substitute for professional care.
- Include clear urgent-care guidance and direct emergency situations to appropriate local emergency services.
- Obtain written permission for identifiable patient stories, photos and testimonials; make consent voluntary and revocable where applicable.

9. Quality Assurance Checklist

- ■ All pages work on common mobile and desktop sizes.
- ■ Navigation, phone links, maps, forms and resource downloads work.
- ■ Forms have labels, validation, clear errors and a confirmation state.
- ■ Keyboard navigation, focus visibility, contrast and video captions are checked.
- ■ No placeholder text, fake reviews, invented staff, unsupported service claims or stock imagery presented as the centre.
- ■ Privacy and consent text reviewed by the appropriate responsible person.
- ■ Security checks include access restrictions, spam protection, secret handling and safe error messages.
- ■ Content owner and update process assigned before launch.

10. Decisions Needed from the Team

- Confirm the centre’s actual services, treatment categories, operating hours, address, contact details and admission process.
- Confirm approved staff profiles, qualifications, photos, facility images and testimonials.
- Choose the frontend stack, hosting, domain, CMS/admin approach and who will maintain the content.
- Decide whether callback enquiries go to a secure dashboard, email or another approved channel.
- Confirm whether Tamil and English are both launch requirements.
- Assign owners for UI/UX, frontend, backend, content, privacy review and QA.

Final recommendation

Build a polished and trustworthy public website first. Prioritise clear information, a private and secure enquiry path, family resources and an interactive recovery roadmap. Add account-based patient features only when the centre’s operational needs, privacy controls and support processes are ready.

Document status: Planning blueprint for team discussion. Scope, stack, timeline and clinical content should be confirmed before implementation.
